Abbreviations

- AA – amino acid
- ACA – anterior cerebral artery
- AIS – acute ischemic stroke
- aPTT – activated partial thromboplastin time
- AVM – arteriovenous malformation
- BOLO – be on the look out
- CT – computed tomography
- CTA – computed tomography angiography
- CTP – computed tomography perfusion
- CVA – cerebrovascular accident
- DBP – diastolic blood pressure
- DOAC – direct oral anticoagulant
- DWI – diffusion-weighted magnetic resonance imaging
- FLAIR – fluid-attenuated inversion recovery sequence
- h – hour(s)
- HTN – hypertension
- ICA – internal carotid artery
- INR – international normalized ratio
- IV – intravenous
- LVO – large vessel occlusion
- MCA – middle cerebral artery
- MI – myocardial infarction
- MRA – magnetic resonance angiography
- MRI – magnetic resonance imaging
- mRS – modified Rankin scale
- NCCT – non-contrast computed tomography
- NIHSS – National Institutes of Health Stroke Scale
- PCA – posterior cerebral artery
- PT – prothrombin time
- rTPA – recombinant tissue plasminogen activator
- SBP – systolic blood pressure
- sICH – symptomatic intracranial hemorrhage
- U.S. – United States

4

Pharmacist

Learning Objectives

Describe the clinical presentations of acute ischemic stroke based on the area of occlusion.

Compare the pharmacokinetic properties and safety profiles of alteplase and tenecteplase.

Evaluate the available literature surrounding the use of tenecteplase beyond the standard 4.5-hour window for acute ischemic stroke.

Given a patient case, assess a patient with acute ischemic stroke and determine if the use of tenecteplase is appropriate.

5

Pharmacy Technician

Learning Objectives

List treatment options for acute ischemic stroke.

Differentiate between the administration techniques for alteplase and tenecteplase for acute ischemic stroke.

Recognize the risk versus benefit of using tenecteplase beyond the standard 4.5-hour window.

6

Love Connection: How Timing & Tenecteplase Meet

7

Prevalence

- Globally, stroke is the **second leading cause of death**
- In the U.S., **every 40 seconds**, someone has a stroke; approximately **every 3 minutes**, someone dies
- About **87%** of all strokes are **ischemic**
- Currently **<10%** are eligible for fibrinolytic therapy due to **strict time constraints**

8

Epidemiology

| | |
|------------------------|--|
| AGE | Can occur at any age, but risk increases with age |
| BIOLOGIC SEX | Female patients admitted with AIS have a higher mortality rate than males |
| RACE/ETHNICITY | Risk of stroke nearly twice as high for non-Hispanic Black adults as for White adults |
| SOCIO-ECONOMICS | Patients at or below the line of poverty at greater risk of stroke |

9

Pathophysiology

Arterial Occlusion → **↓ Cerebral Blood Flow** → **↓ O₂ & Glucose** → **↑ Cell Membrane Alteration** → **↑ Cell Death**

Ischemic Core: Brain tissue that is **irreversibly damaged**

Penumbra: Brain tissue that is **potentially salvageable**

10

Clinical Presentation

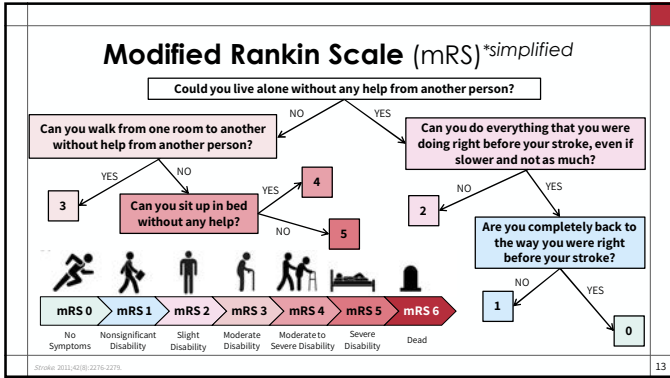

| | |
|----------------------------------|---|
| ANTERIOR CEREBRAL ARTERY | Behavioral changes Weakness: legs >> arms Mild sensory defect |
| MIDDLE CEREBRAL ARTERY | Weakness: face > arms > legs Aphasia Hemisensory defect (L or R) Homonymous hemianopia |
| POSTERIOR CEREBRAL ARTERY | Confusion Amnesia Homonymous hemianopia Visual agnosia |

11

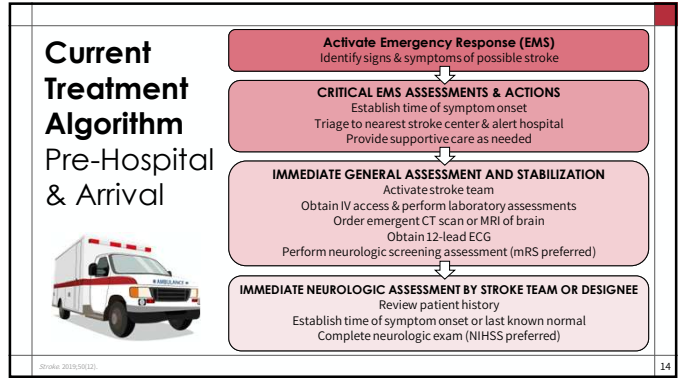

Current Treatment Algorithm Pre-Hospital & Arrival

- Activate Emergency Response (EMS)**
Identify signs & symptoms of possible stroke
- CRITICAL EMS ASSESSMENTS & ACTIONS**
Establish time of symptom onset
Triage to nearest stroke center & alert hospital
Provide supportive care as needed
- IMMEDIATE GENERAL ASSESSMENT AND STABILIZATION**
Activate stroke team
Obtain IV access & perform laboratory assessments
Order emergent CT scan or MRI of brain
Obtain 12-lead ECG
Perform neurologic screening assessment (mRS preferred)

12

13

14

National Institutes of Health Stroke Scale (NIHSS)

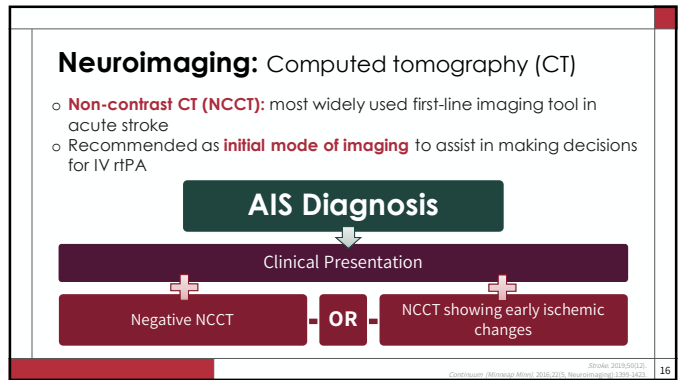

NIHSS Stroke Severity Impacted Brain Density

| NIHSS | Stroke Severity | Impacted Brain Density |
|-------|---------------------------|------------------------|
| 0 | No Stroke | |
| 1-4 | Mild Stroke | |
| 5-15 | Moderate Stroke | |
| 16-20 | Moderate to Severe Stroke | |
| 21-42 | Severe Stroke | |

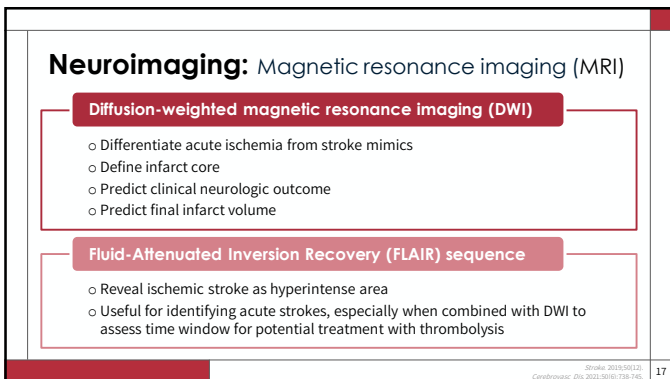

| Item | Title | Responses and Scores | Item | Title | Responses and Scores |
|------|---------------------------|--|--|-----------------------------|---|
| 1a | Level of consciousness | 0—awake 1—drowsy 2—obtusated 3—comatose/unresponsive | 6 | Motor function (MG) | 0—no drift 1—drift before 5 seconds a. Left b. Right 2—falls before 5 seconds 3—no effort against gravity 4—no movement |
| 1b | Orientation questions (2) | 0—answers both correctly 1—answers one correctly 2—answers neither correctly | 7 | Limb ataxia | 0—no ataxia 1—ataxia in 1 limb 2—ataxia in 2 limbs |
| 1c | Response to commands (2) | 0—performs both tasks correctly 1—performs one task correctly 2—performs neither | 8 | Sensory | 0—no sensory loss 1—mild sensory loss 2—severe sensory loss |
| 2 | Gaze | 0—normal horizontal movements 1—partial gaze palsy 2—complete gaze palsy | 9 | Language | 0—normal 1—mild aphasia 2—severe aphasia 3—mutely or global aphasia |
| 3 | Visual fields | 0—no visual field defect 1—partial hemianopia 2—complete hemianopia 3—bilateral hemianopia | 10 | Attention | 0—normal 1—mild dysmetria 2—severe dysmetria |
| 4 | Facial movement | 0—normal 1—minor facial weakness 2—partial facial weakness 3—complete unilateral palsy | 11 | Extinction or perseveration | 0—absent 1—mild loss (1 sensory modality lost) 2—severe loss (2 modalities lost) |
| 5 | Motor function (arm) | 0—no drift 1—drift before 10 seconds a. Left b. Right 3—no effort against gravity 4—no movement | <small>Adapted from Lyden et al. 74 Copyright © 1994, American Heart Association, Inc.</small> | | |

17

18

19

Fibrinolytic Eligibility

Inclusion Criteria

- Age ≥ 18 years
- Clinical diagnosis of ischemic stroke with neurologic deficit
- Time of symptom onset < 4.5 hours from treatment initiation

Exclusion Criteria

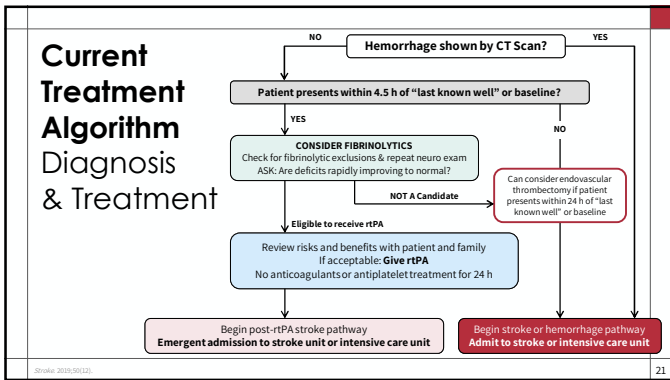

- History of intracranial hemorrhage or ischemic stroke (within 3 months)
- Symptoms/imaging suggesting subarachnoid or intracerebral hemorrhage
- Recent use of direct thrombin inhibitors or factor Xa inhibitors (within 48 hours)
- Use of treatment-dose low molecular weight heparin (within 24 hours)
- Infective endocarditis or intra-axial intracranial neoplasm
- Active internal bleeding or coagulopathy (e.g., platelets <100,000, INR >1.7, aPTT >40s, PT >15s)
- Severe head trauma (within 3 months)
- Gastrointestinal malignancy or bleeding (within 21 days)

Use Clinical Judgement

- Unruptured/unsecured AVM or aneurysm > 10 mm
- Major surgery or non-head trauma
- History of bleeding diathesis
- Extensive hypodensity on initial CT scan

Stroke 2025;0012; 20

21

Pharmacotherapy: Overview

Acute Treatment of Ischemic Stroke – Antiplatelet Agents

| Recommendation | Class (Strength) of Recommendation | Level (Quality) of Evidence |
|---|------------------------------------|-----------------------------|
| Aspirin 160-325 mg daily started within 48 hours of onset | I | A |
| Aspirin 81 mg daily and clopidogrel 75 mg daily for 21 days may be effective in reducing recurrent stroke in patients who do not receive IV alteplase and present with minor, non-cardioembolic stroke (NIHSS ≤3) | I | A |

Stroke 2025;0012; 22

22

Pharmacotherapy: Overview

Acute Treatment of Ischemic Stroke – IV Fibrinolytics

| Recommendation | Class (Strength) of Recommendation | Level (Quality) of Evidence |
|--|------------------------------------|-----------------------------|
| Alteplase 0.9 mg/kg IV (maximum 90 mg) 10% as a bolus with the remainder given over 1 hour | | |
| Within 3 hours of onset | I | A |
| Between 3 and 4.5 hours of onset | I | B-R |
| Tenecteplase 0.25 mg/kg IV bolus (maximum 25 mg) may be a reasonable alternative to alteplase for patients who are also eligible to undergo mechanical thrombectomy | IIb | B-R |

European Stroke Organisation Recommendation

For patients who are eligible for intravenous thrombolysis, tenecteplase 0.25mg/kg can be used as a safe and effective alternative to alteplase 0.9 mg/kg

Stroke 2025;0012; 23

23

24

Pharmacotherapy: Alteplase vs. Tenecteplase

| Agent | Alteplase | Tenecteplase |
|---------------------------------|-----------|--|
| Structural modifications | ----- | asparagine-117 → glutamate threonine-103 → asparagine AA 296-299 → tetra-alanine |
| Plasma half-life (min) | ~5 | ~20 |
| Clearance (mL/kg/min) | 16.2 | 1.9 |
| Fibrin specificity | ++ | +++ |
| PAI-1 resistance | - | ++ |
| Thrombolytic potency | + | +++ |

The Lancet Neurology. 2014;13(12):1064-1065.

25

Pharmacotherapy: Fibrinolytic Evolution

- 1995 NINDS:** Established initial time frame of alteplase administration within 3 hours of onset
- 2008 ECASS III:** Extended the time frame of alteplase administration to 4.5 hours of onset
- 2018 EXTEND-IA TNK:** Tenecteplase superior to alteplase when administered within 4.5 hours of onset
- 2019 EXTEND:** Attempted to extend the time frame of alteplase administration to 9 hours

Stroke. 2015;46(12):European Stroke Journal 2017;18(1):4-5a.

Journal of Stroke. 2023;25(3):371-377.

27

Intravenous Tenecteplase for Acute Ischemic Stroke Within 4.5–24 Hours of Onset (ROSE-TNK)

Journal of Stroke. 2023;25(3):371-377.

28

Study Objective & Design

To determine the effect of intravenous tenecteplase for acute ischemic stroke within 4.5 to 24 hours of onset

Phase II

- Randomized
- Investigator-initiated
- Multicenter
- Blinded endpoints

Journal of Stroke. 2023;25(3):371-377.

29

Inclusion Criteria

- Acute ischemic stroke confirmed by CT or MRI
- First stroke onset or past stroke without obvious neurological deficit (mRS≤1)
- NIHSS Score: 6-25
 - or NIHSS score ≤ 5 but responsible vessel occlusion or severe stenosis on CTA/MRA
- Imaging Requirements:
 - DWI infarct region: no more than 1/3 of MCA territory or 1/2 of ACA territory or 1/2 of PCA territory
 - DWI infarct volume <70 mL
 - Presence of DWI/FLAIR mismatch
- Patient Age: 18 – 80
- The time from onset to treatment: 4.5 – 24 h

Journal of Stroke. 2023;25(3):371-377.

30

Exclusion Criteria

- Planned endovascular treatment
- Serious neurological deficits before onset (mRS ≥ 2)
- SBP ≥ 185 mmHg or DPB ≥ 110 mmHg
- Blood glucose < 50 mg/dL
- Oral warfarin is being taken and INR > 1.6 or aPTT abnormal
- MI within 3 months
- Intracranial or spinal cord surgery within 3 months
- Major surgery within 1 month

Journal of Stroke 2023;25(3):371-377

31

Interventions

TNK

Intravenous tenecteplase 0.25 mg/kg (max dose: 25 mg) administered as a single IV bolus

Control

Standard Medical Treatment

- Antiplatelets, statins, blood pressure, & glucose control

Journal of Stroke 2023;25(3):371-377

32

Endpoints

Primary Endpoint

- Excellent functional outcome (90-day mRS scores 0-1)

Safety Endpoints

- sICH within 48 h
- Any bleeding events within 7 days
- Death within 14 days

Secondary Endpoints

- Favorable functional outcomes (90-day mRS scores 0-2)
- Change in NIHSS score from baseline to 24 h after randomization
- Change in NIHSS score from baseline to 7 days after randomization
- Early neurological improvement

Journal of Stroke 2023;25(3):371-377

33

Statistical Analysis

Unadjusted Intention to Treat Analysis

Categorical Data: Chi-square test
 Continuous Data: Rank Sum test, T-test

Covariate-adjusted binary logistic regression analyses performed for all outcomes, adjusting for 6 pre-specified prognostic factors

- Age
- Sex
- SBP
- Previous ischemic stroke
- NIHSS at presentation
- Time from onset to randomization

Journal of Stroke 2023;25(3):371-377

34

Study Sample

Sample Size 80 patients from 14 hospitals in China

TNK n = 40

Standard Medical Treatment n = 40

Median time from symptom onset to treatment: ~ 12 h

Journal of Stroke 2023;25(3):371-377

35

Baseline Characteristics

| Characteristic | TNK | Standard Medical Treatment |
|--------------------------|----------|----------------------------|
| Median Age | 63 years | 63 years |
| Male Sex | 77.5% | 65% |
| Hypertension | 60% | 70% |
| Diabetes | 22.5% | 32.5% |
| Current Smoker | 47.5% | 52.5% |
| Previous Ischemic Stroke | 27.5% | 30% |
| Admission NIHSS score | 7.5 | 7 |
| Large vessel occlusion | 42.5% | 45% |
| Wake up stroke | 60% | 57.5% |

Journal of Stroke 2023;25(3):371-377

36

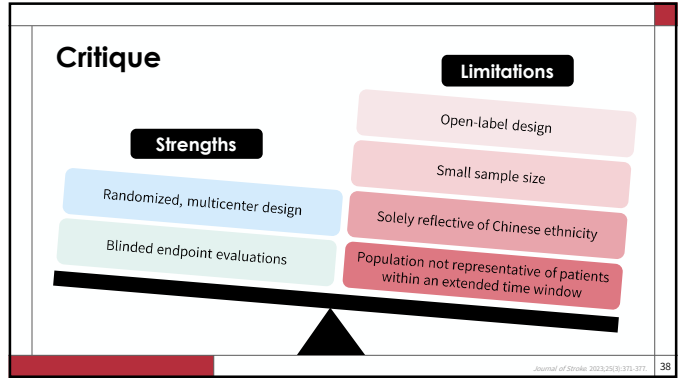

Results

| Outcome | TNK | Standard Medical Treatment | Adjusted OR (95% CI) | P-value |
|-----------------------------------|-------|----------------------------|----------------------|---------|
| Primary Outcome | | | | |
| Excellent functional outcome | 52.5% | 50% | 1.10 (0.41-2.97) | 0.85 |
| Secondary Outcomes | | | | |
| Favorable functional outcomes | 65% | 60% | 1.44 (0.49-4.22) | 0.50 |
| Change in NIHSS score at 24 h | -2 | 0 | -1.11 (-2.49-0.26) | 0.11 |
| Change in NIHSS score at 7 days | -3 | -2 | -0.21 (-1.67-1.26) | 0.78 |
| Early neurological improvement | 27.5% | 7.5% | 5.00 (1.16-21.50) | 0.03 |
| Safety Outcomes | | | | |
| sICH within 48 h | 0 | 0 | | |
| Any bleeding events within 7 days | 0 | 0 | | |
| Death within 14 days | 0 | 0 | | |

NO LOVE LOST

Journal of Stroke. 2023;25(3):371-377

37

38

Interpretation

When compared to standard medical treatment, TNK administered between 4.5 to 24 h after stroke onset

- Showed improved early neurologic outcomes
- Did not present a significant safety risk

TNK may be a safe option for patients with AIS who present within the 4.5-to-24-hour window after "last-known-well"

Journal of Stroke. 2023;25(3):371-377

39

Tenecteplase for Ischemic Stroke at 4.5 to 24 Hours without Thrombectomy (TRACE-III)

New England Journal of Medicine. 2024;391(3):203-212.

Journal of Stroke. 2023;25(3):371-377

40

Study Objective & Design

□ To investigate the efficacy and safety of TNK administered 4.5 to 24 h after stroke onset in patients with salvageable tissue and no access to endovascular thrombectomy

Phase III

Multicenter

Randomized

Open-label

Blinded-endpoints

New England Journal of Medicine. 2024;391(3):203-212

41

Inclusion Criteria

Internal carotid artery, middle cerebral artery (M1 or M2) occlusion confirmed by CTA/MRA

Pre-stroke mRS≤1

NIHSS Score
 Baseline: 6 – 25

The time from onset to treatment:
 4.5 - 24 h (including wake-up stroke & unwitnessed stroke)

Imaging Requirements:

- Target mismatch profile on CTP or MRI+MR perfusion
- Ischemic core volume < 70mL, mismatch ratio ≥ 1.8, and mismatch volume ≥ 15mL identified by validated automated evaluation software

Patient Age:
 ≥ 18

New England Journal of Medicine. 2024;391(3):203-212

42

Exclusion Criteria

- Anticipated endovascular treatment
- SBP \geq 180 mmHg or DBP \geq 100 mmHg
- Any known impairment in coagulation
- Blood glucose > 400 mg/dL OR < 50 mg/dL
- Hypodensity in >1/3 MCA territory on NICCT
- Intracranial hemorrhage or ischemic stroke within 3 months
- Multiple arterial occlusion
- Acute or past ICH identified by CT or MRI

New England Journal of Medicine 2024;391(3):209-212

43

Interventions

TNK

Intravenous tenecteplase 0.25 mg/kg (max dose: 25 mg) administered as a single IV bolus

Control

Standard Medical Treatment

- Aspirin 100 mg combined with clopidogrel 75 mg, aspirin 100 mg alone, or clopidogrel 75 mg alone

New England Journal of Medicine 2024;391(3):209-212

44

Endpoints

Primary Endpoint

- Absence of disability (90-day mRS scores 0-1)

Safety Endpoints

- sICH within 36 h
- Death from any cause within 90 days
- Moderate or severe systemic bleeding within 90 days
- Any adverse events within 90 days

Secondary Endpoints

- Functional independence (90-day mRS scores \leq 2)
- Major neurologic improvement at 72 h after treatment (defined as a reduction from baseline of \geq 8 points on the NIHSS or an NIHSS score of \leq 1)
- Reperfusion at 24 h after treatment
- Change from baseline in NIHSS score at 7 days

New England Journal of Medicine 2024;391(3):209-212

45

Statistical Analysis

Unadjusted Intention to Treat Analysis

Categorical Data: Chi-square test, Fisher's Exact test, Rank Sum test, T-test

Continuous Data: T-test

Logistic regression analyses performed for the primary efficacy outcome, adjusting for 6 pre-specified factors

- Age
- HTN
- Diabetes
- Site of LVO
- NIHSS at presentation
- Onset-to-treatment time

Journal of Stroke 2022;53(5):971

46

Study Sample

Sample Size 516 patients from 58 centers in China

TNK

n = 264

Standard Medical Treatment

n = 252

Median time from symptom onset to treatment: ~ 12.4 h

New England Journal of Medicine 2024;391(3):209-212

47

Baseline Characteristics

| Characteristic | TNK | Standard Medical Treatment |
|----------------------------|----------|----------------------------|
| Median Age | 67 years | 68 years |
| Male Sex | 69.3% | 66.3% |
| Hypertension | 67% | 71.4% |
| Diabetes | 26.1% | 28.2% |
| Atrial Fibrillation | 18.6% | 19% |
| Median NIHSS score | 11 | 10 |
| Baseline mRS score of 1 | 87.1% | 85.7% |
| Baseline mRS score of 0 | 12.9% | 14.3% |
| Known onset of stroke time | 54.2% | 59.1% |
| Wake up stroke | 38.3% | 33.3% |

New England Journal of Medicine 2024;391(3):209-212

48

Results

| Outcome | TNK | Standard Medical Treatment | Effect Size (95% CI) | NNT |
|--|-------|----------------------------|------------------------------|-----|
| Primary Outcome | | | | |
| Absence of disability | 33% | 24.2% | 1.37 (1.04-1.81) p = 0.03 | 12 |

50

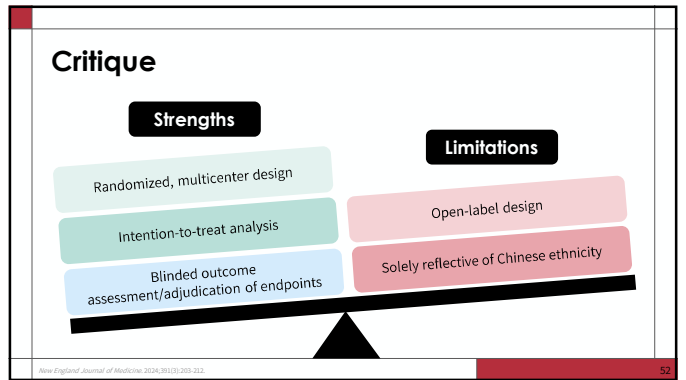

Results – Subgroup Analysis

Relative Rate of a mRS Score of 0 or 1 at 90 Days (control vs. tenecteplase)

| | |
|--|--|
| Overall | 24.2% vs. 33% [95% CI, 1.37 (1.04–1.81)] |
| Male Sex | 25.8% vs. 36.6% [95% CI, 1.42 (1.03–1.95)] |
| Time from symptom onset to treatment > 9 to 24 h | 25.4% vs. 36.5% [95% CI, 1.44 (0.96–2.17)] |
| MCA Occlusion | M1: 23.1% vs. 32.8% [95% CI, 1.43 (0.95–2.15)] M2: 21.1% vs. 39.7% [95% CI, 1.89 (0.94–3.82)] |

New England Journal of Medicine. 2024;391(3):209-222.

51

52

Interpretation

When compared to standard medical treatment, tenecteplase administered between 4.5 to 24 hours after stroke onset

- Improved disability-free recovery
- Did not present significant safety risk

Tenecteplase may be a safe and efficacious treatment option for patients suffering from acute ischemic stroke due to large vessel occlusion within 4.5-to-24-hour window after "last-known-well" in facilities that do not have thrombectomy capabilities

New England Journal of Medicine. 2024;391(3):209-222.

53

Tenecteplase for Stroke at 4.5 to 24 Hours with Perfusion-Imaging Selection (TIMELESS)

New England Journal of Medicine. 2024;390(8):701-711.

New England Journal of Medicine. 2024;391(3):209-222.

54

Study Objective & Design

□ To test if intravenous tenecteplase, given 4.5 to 24 hours after stroke onset, benefits patients with large-vessel occlusion and salvageable ischemic brain tissue

Phase III

Multicenter Double-blind Randomized Placebo-controlled

New England Journal of Medicine 2024;390(8):703-711

55

Inclusion Criteria

Acute ischemic stroke confirmed by CT or MRI

Functionally independent prior to stroke onset (mRS_{s2})

NIHSS Score: ≥ 5

Remains ≥5 immediately prior to randomization

The time from onset to treatment: 4.5 - 24 h (including wake-up stroke)

Patient Age: ≥ 18

Imaging Requirements:

- ICA or M1, M2 occlusion (carotid occlusions can be cervical or intracranial, with or without tandem MCA lesions) by MRA or CTA
- AND**
- Target mismatch profile on CT perfusion or MRI (ischemic core volume <70 mL, mismatch ratio is >1.8 and mismatch volume is >15 mL)

New England Journal of Medicine 2024;390(8):703-711

56

Exclusion Criteria

- Planned endovascular treatment
- SBP ≥185 mmHg or DBP ≥110 mmHg
- Blood glucose > 400 mg/dL OR < 50 mg/dL
- Treatment with a thrombolytic ≤ 3 months
- Active internal, subarachnoid, or intracranial hemorrhage
- PMH of intracranial hemorrhage or tumor
- Use of a DOAC within 48 hours
- Previous CVA within 90 days

New England Journal of Medicine 2024;390(8):703-711

57

Interventions

TNK

Intravenous tenecteplase 0.25 mg/kg (max dose: 25 mg) administered as IV bolus

Control

Placebo administered as IV bolus

New England Journal of Medicine 2024;390(8):703-711

58

Endpoints

Primary Endpoint

- Ordinal mRS score at day 90

Safety Endpoints

- sICH within 36 h
- Death within 30 days
- Death within 90 days

Secondary Endpoints

- Functional independence (90-day mRS scores 0 - 2)
- Recanalization of implicated vessel at 24 h
- Reperfusion at 24 h after randomization

New England Journal of Medicine 2024;390(8):703-711

59

Statistical

NOTICE

- Data management and site monitoring was overseen by Genentech
- Data analysis was performed by two authors who are employees of Genentech

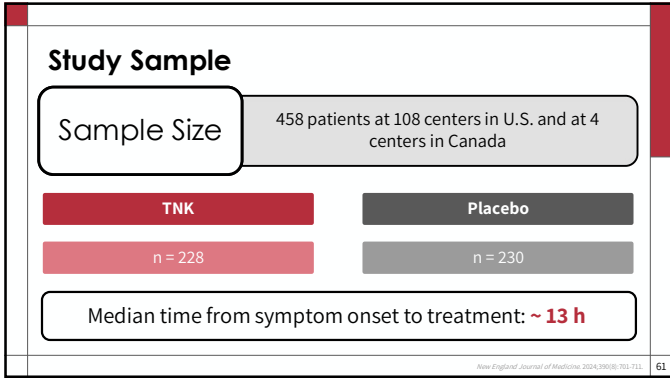

The primary endpoint is defined as the proportion of patients in each treatment group who are functionally independent at day 90. The primary endpoint is defined as the proportion of patients in each treatment group who are functionally independent at day 90.

Age Occlusion Location Size

NO LOVE LOST

New England Journal of Medicine 2024;390(8):703-711

63

64

65

Interpretation

When compared to placebo, tenecteplase initiated 4.5 to 24 hours after stroke onset

- Did not provide benefit to patients
- Did not cause harm to patients or present significant safety risk

Tenecteplase may be a safe option for patients who present within 4.5-to-24-hour window after "last-known-well" who have access to endovascular thrombectomy

New England Journal of Medicine 2024;390(8):703-711

The Final Rose: What's Next for Stroke Treatment with Tenecteplase?

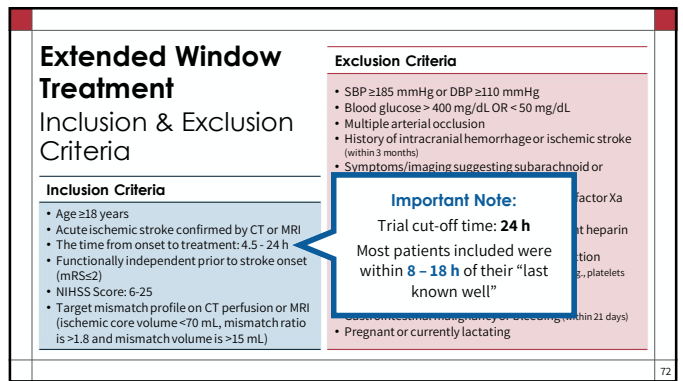

69

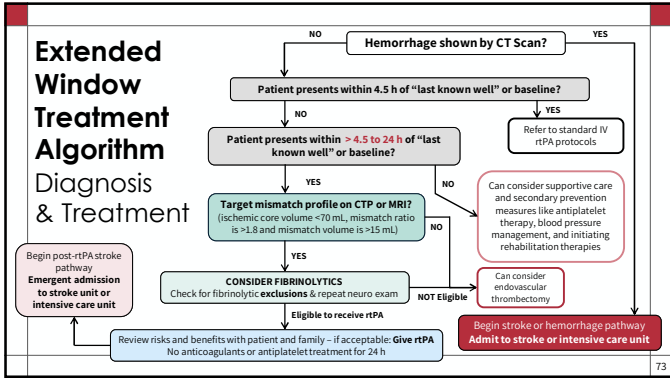

70

71

72

73

CHABLIS-T II

- Chinese Acute Tissue-Based Imaging Selection for Lysis In Stroke Tenecteplase II
- Multicenter, prospective, block-randomized, open-label, blinded-endpoint, phase IIb study
- Aiming to explore efficacy and safety of TNK in Chinese patients who had acute ischemic stroke with large/medium vessel occlusion in an extended time window

ETERNAL-LVO

- Extending the Time Window for Tenecteplase by Effective Reperfusion in Patients with Large Vessel Occlusion
- Prospective, randomized, open-label, blinded endpoint design
- Will compare IV tenecteplase to standard care (which may include IV alteplase)

74

Ready to Commit?

Let's See How Well You Know the Treatment Window!

75

Which clinical presentation is most likely to be seen with an occlusion of the middle cerebral artery (MCA)?

- Hemispatial neglect and visual field deficits
- Confusion and amnesia
- Aphasia and hemisensory defect (left or right)
- Ataxia and behavioral changes

76

Which pharmacokinetic property most significantly influences the clinical advantage of tenecteplase over alteplase in the management of acute ischemic stroke?

- The longer half-life of tenecteplase allows for a single IV bolus administration compared to the prolonged infusion required for alteplase.
- The lower volume of distribution of tenecteplase ensures a more targeted action at the site of thrombus compared to alteplase.
- Both alteplase and tenecteplase have the same pharmacokinetic properties, with no significant difference in fibrin affinity or half-life.
- Tenecteplase undergoes a significantly more extensive first-pass metabolism than alteplase, leading to reduced systemic exposure.

77

Which best describes the TIMELESS, TRACE-III, and ROSE-TNK trials' collective contribution to the use of tenecteplase in patients presenting beyond the standard 4.5-hour window for acute ischemic stroke?

- The trials collectively support the use of tenecteplase only up to 6 hours after symptom onset.
- The trials show that tenecteplase is potentially an effective treatment option for acute ischemic stroke patients up to 24 hours from symptom onset with no significant safety concerns.
- The trials recommend mechanical thrombectomy as the preferred treatment for patients presenting beyond the 4.5-hour window, regardless of penumbra size.
- The trials emphasize the importance of using alteplase over tenecteplase beyond the 4.5-hour window due to the increased risk of bleeding with tenecteplase.

78

Ms. Joan Vassos, a 62-year-old woman with a PMH of anxiety, presents 8 hours after the sudden onset of right-sided weakness, dysphasia, and slurred speech. CTA shows an occlusion in the right MCA, and perfusion imaging reveals a small ischemic core (25 mL) with a large penumbra (80 mL). Her NIHSS score is 15. This is her first ischemic stroke.

79

Based on the literature presented, could tenecteplase be an appropriate treatment option for this patient?

- A. Yes; Her small infarct core and large penumbra make her a candidate for tenecteplase up to 24 hours after symptom onset.
- B. Yes; She is having a mild stroke so tenecteplase is only indicated for mild strokes.
- C. No; She is beyond the 4.5-hour window and should receive mechanical thrombectomy instead of thrombolysis.
- D. No; Her occlusion is in the MCA so she should receive a mechanical thrombectomy instead.
